

At a Glance

Wholesale settlement infrastructure for digital markets.

Fnality delivers final settlement in central bank money balances, the safest form of money in the financial system.

Backed by leading global financial institutions

The gold standard for global settlement

Digital markets are scaling across platforms, currencies and jurisdictions. But faster execution alone does not reduce risk.

Settlement quality determines how efficiently institutions use liquidity, capital and risk capacity. Fnality brings atomic, programmable, final settlement into digital environments, enabling global markets to scale without compromise.

How Fnality works

- 1 Central bank money balances**
 Fnality enables digital settlement in central bank money balances, within the central bank supervisory perimeter.
- 2 A global multi-currency design**
 Each Fnality Payment System (FnPS) is designed to enable multi-currency, cross-border settlement.
- 3 Programmable settlement**
 Payments and assets can move together when agreed conditions are met, reducing operational and settlement risk while providing legal finality.

*Central bank licence applications in progress

Expanding across global markets

UK — LIVE
